Closing the Endpoint Gap

with Lenovo Device Orchestration and ThinkShield Firmware Assurance

"Endpoint security does not stop at the operating system. Another challenge begins below it, where visibility, control, and trust matter most."

The Journey

How everything started

Lenovo Device Orchestration

Overview

LDO in the Field

Experiences and Demo

ThinkShield Firmware Assurance

The big question about the “WHY” with Demo

Wrap-Up

Usecases and Benefits

Key takeaways:

- You know everything about LDO and TSFA
- You found your new Intune Companion Tool **to manage your Lenovo Device Fleet**

The Journey

Before Lenovo Device Orchestration

The Journey

#WPNinjaCH

1

Idea to manage Company Devices

2

MDM Project

3

Intune Addons

Device Hardening

4

What's Next?

Challenges

- Driver & Firmware Update Management
- Driver Rollback
- Firmware Security
- BIOS Configuration
- Inventory

The Journey

Don’t forget them ☺

The Journey

So let the story begin

How everything started

It all started with a question and a meeting...

- Some Setup attempts
- Great Support Engineer
- Chats and a lots of feedback back to Lenovo

How everything started

At the beginning

- The solution needed too many graph permissions
- The frontend wasn’t fast enough
- The whole solution felt a bit “beta-like”

How everything started

But then..

- Lenovo implemented and changed a lot
  - Based on our feedback

- The backend got a complete overhaul
- The solution needs less graph permissions now
- Overall it feels more like a finished product
- Many great features will come in the near future

The Journey

#WPNinjaCH

Official Partner Portal

Lenovo Device Orchestration (LDO) link in the Intune admin center

Microsoft Intune continues to expand its **Partner portals** experience, giving admins a single, secure interface to manage devices across multiple OEM ecosystems. A new integration is in development to provide a direct link to Lenovo Device Orchestration (LDO) from the Intune admin center.

When this feature becomes available, IT admins will be able to open the Lenovo Device Orchestration Portal directly from the Intune admin center to use Lenovo-specific management capabilities for supported devices.

Applies to:

- ✓ Windows 11

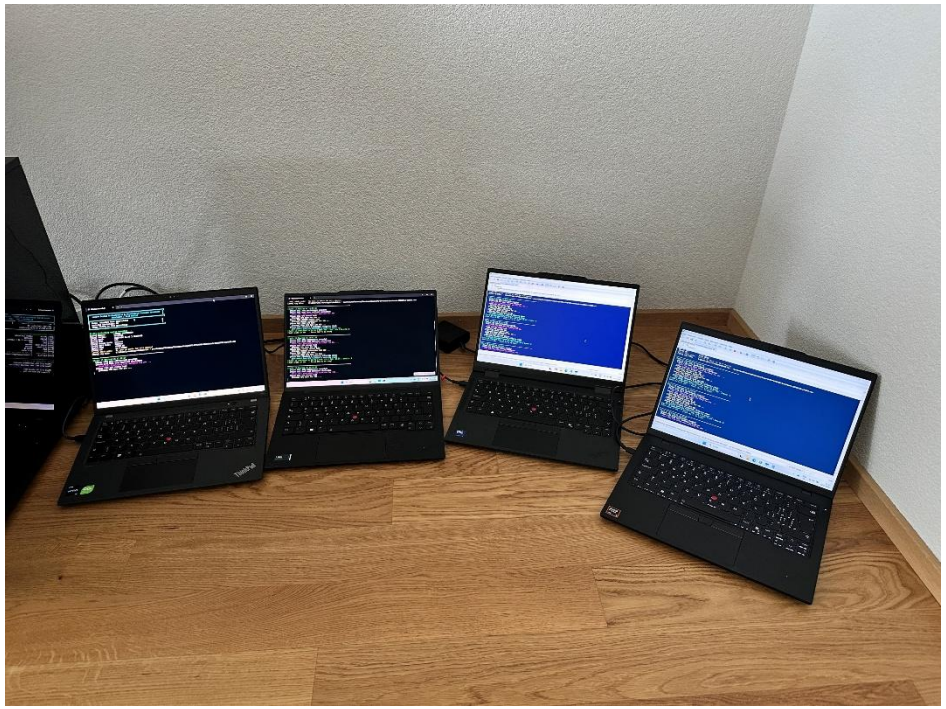
- **1** self made Benchmark / Data generation Script



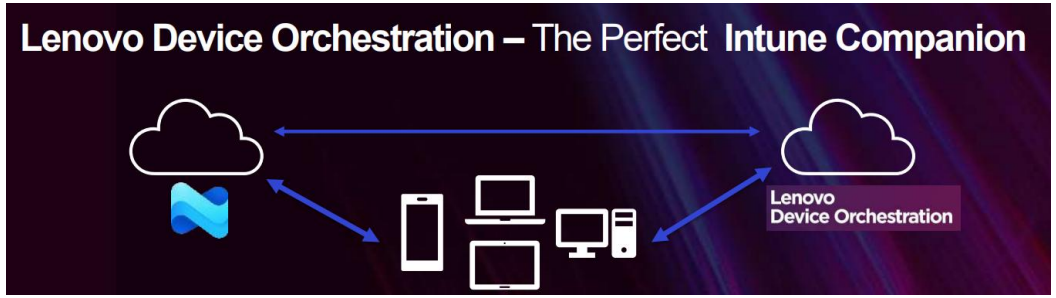
Lenovo Device Orchestration

Overview

Lenovo Device Orchestration

#WPNinjaCH

Overview



Lenovo Solution

- Intune Companion
- Centralized dashboard for fleet health, security, and performance
- AI-assisted device insights and personalized support
- Multi-tenancy for managed service providers (MSPs)

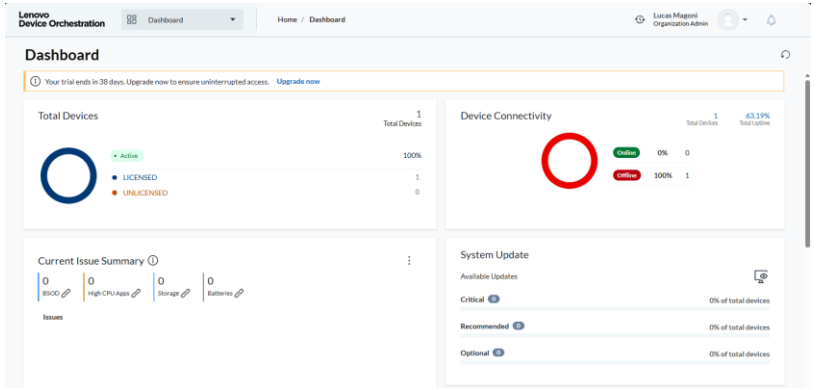
Lenovo Device Orchestration

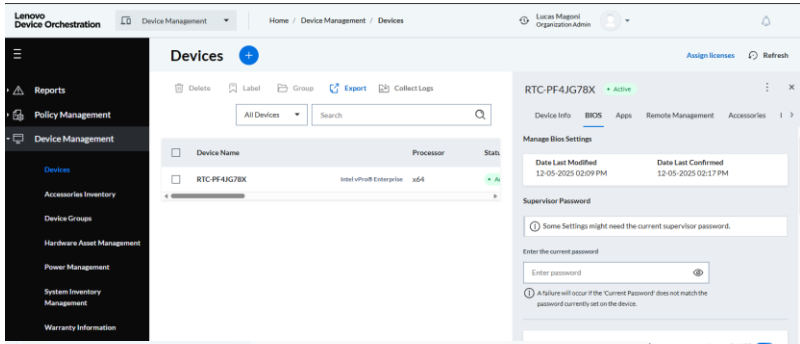
#WPNinjaCH

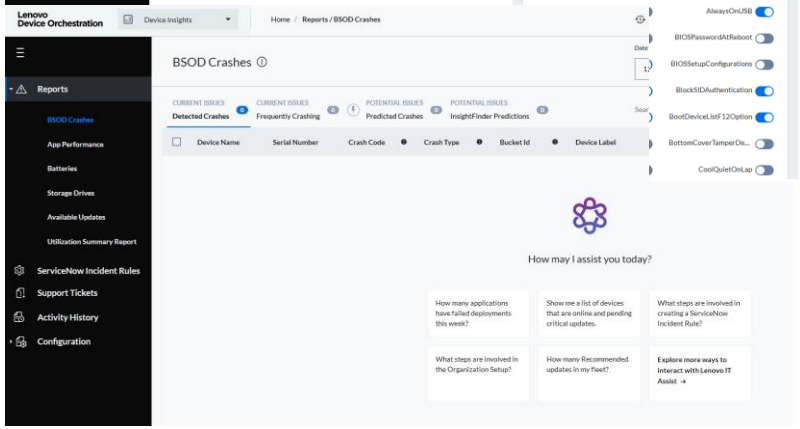
Overview

Lenovo Solution

- **4 Modules**
  - Centralized Endpoint Management
  - Device Management
  - Device Insights
  - Lenovo IT Assist

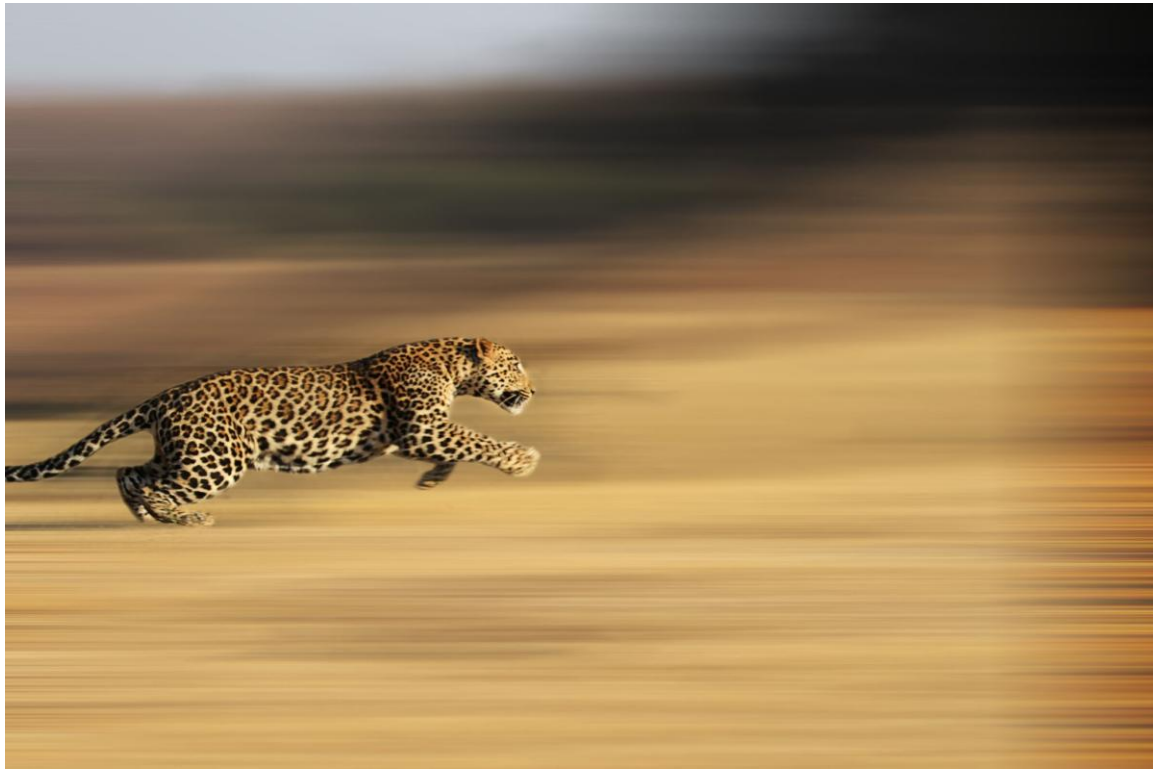






Overview

It’s Agent based



- ✓ Can be deployed with Intune
- ✓ Click to Deploy Feature available (soon)
- ✓ No performance impact

Automatically scan (only) for new updates — Enabled

Will check for new updates every Monday at 6am ET.
New updates will automatically appear on System Update page.

Automatically Scan and Update — Disabled

To always keep systems secure and updated, select this option.

If an update has a Reboot Required indicator, a reboot must occur before remaining updates will install.

Automatically Install System Update Add-in — Enabled

Automatically installs System Update Add-in if it is not detected on device. This is required for System Update operations.

System Update messaging & deferrals

Some system updates require the device to be restarted in order for the installation to complete.

Number of update deferrals allowed by End User:

5

Set time between end-user notification and the beginning of the update installation

2

Hour(s)

Update Testing — Enabled

Allows the ability to select one or more devices OR device group(s) to test an available System Updates. Update(s) can be selected from the System Update page and flagged to place them in a test phase. Users can then choose the device(s) or device group(s) and then configure the start and end date for the test. This update will then be blocked from installation on any other device until the user has approved it for rollout.

If there are any active tests or updates, you won't be able to disable this feature.

LDO in the Field

#WPNinjaCH

Links firmware issues to device health to speed troubleshooting

Windows Device Manager

GraphicsCard 1 Error

NVIDIA RTX A500 Laptop GPU Error 43

Full Error Message

Windows Has Stopped This Device Because It Has Reported Problems

Cause

One of the drivers controlling the device notified the operating system that the device failed in some manner.

Remediations

Option 1: Open Device Manager to uninstall device. When the computer restarts, the operating system will find the device and install the driver.

Option 2: Typically these errors are software-related and can be resolved by updating your device drivers.
You can find more about Error Codes in Device Manager here

Great features right?

But you might ask yourself a **very important question**?

Where is the Darkmode?

It’s on the roadmap! Together with a completely redesigned UI

Maybe other questions?

ThinkShield Firmware Assurance

Why Firmware Assurance Matters

"You cannot secure what you cannot see, especially below the operating system.."

The famous WHY

From a SOC perspective

- The software on the device can be highly protected
  - But what if an attacker gets physical access to the device?
  - How can you discover this?
  - How can you react and remediate such an attack?
  - How do those signals come into your SIEM Solution?

ThinkShield Firmware Assurance

Overview

ThinkShield Firmware Assurance

#WPNinjaCH

Overview

AI-driven firmware and BIOS integrity monitoring

- Triple-layer protection
  - Security chip, OS agent, and cloud platform
- Detects hidden below-OS attacks
  - Continuously verifies firmware integrity
  - Enables early anomaly detection and response
- Supports firmware security compliance and audits

The main Benefit for your organization:
The solution enhances and supports your Zero Trust journey.

ThinkShield Firmware Assurance

Wrap-Up

Usecases and Benefits

Lenovo Device Orchestration

Operational Value

- Closes important operational gaps across driver and firmware updates, rollback, BIOS configuration, inventory, and power management
- Extends endpoint management with a centralized view of fleet health, security, and performance

Lenovo Device Orchestration

Strategic Value

- Acts as a strong Intune companion for Lenovo device fleets
- Scales well for larger environments, including MSP multi-tenancy scenarios

ThinkShield Firmware Assurance

Operational Value

- Establishes a trusted firmware foundation for enterprise endpoints
- Continuously validates firmware integrity to strengthen trust below the operating system
- Detects hidden below-OS attacks and enables early anomaly detection.

ThinkShield Firmware Assurance

Strategic Value

- Improves centralized fleet visibility for firmware-related security signals.
- Supports faster reaction and response when firmware anomalies or tampering indicators appear
- Supports a broader Zero Trust journey by extending visibility into a layer that is often difficult to monitor.
